CISCO SYSTEMS

Deploying Large-Scale H.323 VoIP SP Networks

Session VVT-221

Core Message

- **H.323 networks can be used in large service provider VoIP networks, if proper architecture and features are deployed**

Pondering H.323 for Large-Scale SP Networks

Cisco.com

- What are the key components in a large-scale H.323 network?
- How can we design the H.323 network to scale?
- What are the performance criteria to design around?
- How can we size the network?
- What are some configuration examples?
- How do we increase availability?
- What are some case study examples?
- What else should I consider?

VVT-221

5

Today's Agenda

Cisco.com

- Review of H.323 Architecture
- Anatomy of a Large-Scale H.323 SP Network
- Gatekeeper Core and Components
- Call Routing in the H.323 Network
- Network Dimensioning
- Case Study: Dimensioning of an ITSP
- Increasing Availability

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

6

Today's Agenda

Cisco.com

- **Billing in the H.323 Network**
- **Security**
- **Expanding the Coverage Area**
- **Interconnecting to TDM-Based Carriers**
- **Interconnecting to IP-Based Carriers**
- **Interconnecting with Non-Cisco-Based Carriers**
- **Other Services: Card Services**
- **Network Management Solutions**
- **What's Next?**

H.323 VoIP Review Signaling Call Flow

H.323 VoIP Review Addition of the Gatekeeper

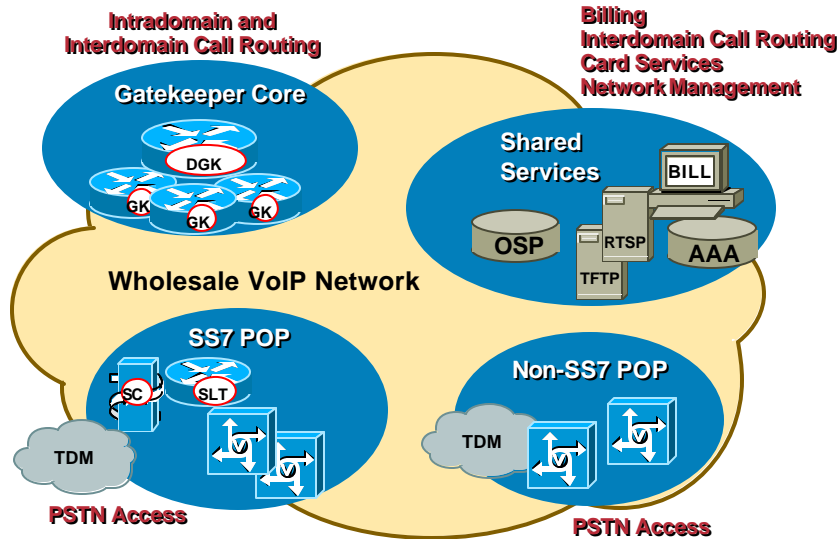

Anatomy of Large-Scale H.323 Network

Needs of Large H.323 Networks

- Accommodate large number of POPs
- Allow new POPs to be added
- Manage POPs centrally
- Support a scaleable dial plan
- Handle high volume of minutes
- Keep call success rates high
- Maintain high availability
- Enable only authorized usage
- Support interconnecting with other TDM (SS7 or non-SS7) or IP carriers

Large-Scale H.323 Functions

16

Gatekeeper and Gateway Core

Gateways

- Provides interface between PSTN and IP
- Grooms dial plan for easier management and higher scaling
- Generates billing data (start/stop records) to billing server (AAA/RADIUS or OSP)
- Hosts Interactive Voice Response (IVR) application
- Supports redundancy mechanisms
- Supports bandwidth efficiency mechanisms
- Supports security mechanisms

Gatekeepers

Cisco.com

- Maintain registration of GWs and administers zone
- Manages GW resources to increase availability
- Maintain call routing information (zone prefix tables)
- Supports redundancy mechanisms
- Supports GKTMP interface for enhanced call routing and services

VVT-221

20

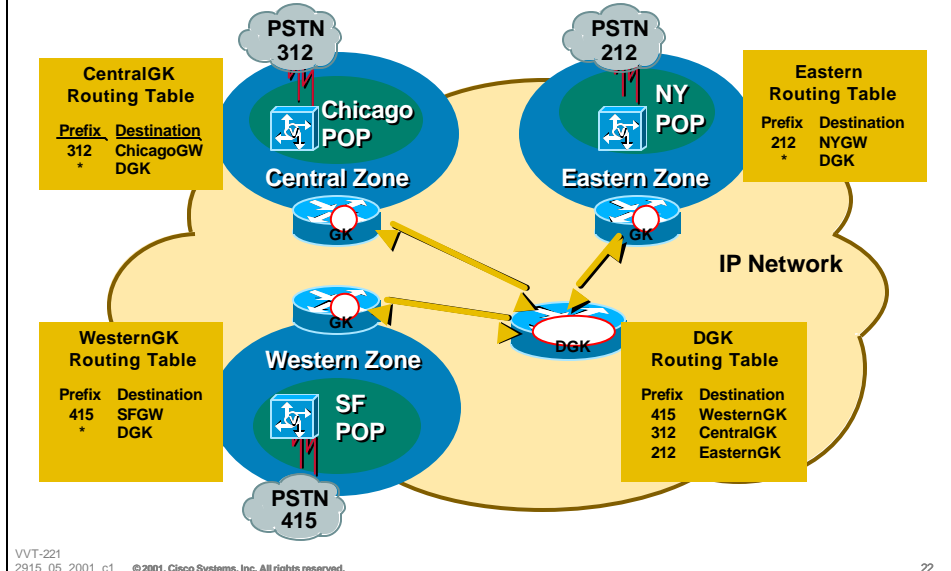

Gateway and Gatekeeper

Cisco.com

Adding a Directory Gatekeeper

Cisco.com

Directory Gatekeeper

Cisco.com

- Create a hierarchical architecture of GKs
- Performs inter-regional call routing
- Eliminate need for fully-meshed gatekeeper configuration
- Maintain master zone prefix table
- Simplify dial-plan management when GK zones are added or deleted
- Performs interdomain call routing

© 2001, Cisco Systems, Inc. All rights reserved.

27

Adagio Components Gatekeeper Core Summary

Cisco.com

- **Directory Gatekeeper**

Performs call routing search at highest level

Example = Country Code Distributes

Country codes among other DGKs Forwards LRQ to Partner DGK if call doesn't terminate in local SP DGK

- **Gatekeeper**

Performs call routing search at intermediate level

Example = NPA-NXX

Distributes NPA among other GKs

Provides GW resource management (RAI, gw-priority...)

Provides Zone maintenance

- **Gateway**

Acts as interface between PSTN and IP

Normalizes numbers from PSTN before entering IP

Normalizes numbers from IP before entering PSTN

Contains the dial peer configuration

Registers to GK

Service
Provider
POP-A

2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

35

Translation Rules Example

Cisco.com

Translation-rule 1

Rule 0 ^5.... 408525

Rule 1 ^6.... 408526

Rule 2 ^7.... 408527

Rules say that for any digit pattern beginning with a 5, 6, or 7 followed by any 4 digits, then prepend with a 408525, 408526 or 408527

i.e.. 51234 translates to 4065251234

External URL needed here

http://von.cisco.com/Solutions/ios_dial_plan_digit_manipulation_enhancements.htm

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

36

Translation Rules Example (Cont.)

Cisco.com

Where do you apply translation rules?

Method 1: Applying Rules to POTS/VoIP Dial Peers
Method 2: Applying Rules to a physical POTS interface

Example:

```
!  
translation-rule 1  
  Rule 0 ^5.... 408525  
  Rule 1 ^6.... 408526  
  Rule 2 ^7.... 408527  
!  
port 1/0/0  
translation called 1
```

Useful commands:
debug translation-rule detail
test translation-rule 1 51122

VVT-221

41

Designing the POP

Cisco.com

- Design the SP POP with following factors
 - Busy Hour Call Attempts (BHCA)**
 - Number of gateways required to handle the anticipated call volume**
 - Number of Gatekeepers required to process the GW signaling/RAS messages**

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

42

Sizing Exercise

Cisco.com

Given:

- 1,000,000 BHCA network with average hold time = 3 minutes
- Max BHCA per DS0 = 60 min/hour/3 min HT = 20 BCHA per GW
- DS0s per GW will depend on signaling type
- 92 T1 DS0s (PRI) max on AS5300, 92 X 20 BHCA/DS0 = 1840
- 96 T1 DS0 (CAS) max on AS5300, 96 X 20 BHCA/DS0 = 1920
- 120 E1 DS0s max on AS5300, 120 X 20 BHCA/DS0 = 2400

	T1 PRI	T1 CAS	E1 PRI	E1/R2
GW BHCA	1840	1920	2400	2400
# GWs	544	521	417	417
# Zones	6	6	5	5

45

Brand A Network Map

Cisco.com

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

46

Customer A Design Needs

Cisco.com

- Allow for POPs located in 5 cities
- Traffic needs
18,000 BHCA for each POP
- Enable network to scale to allow future addition of 5 new POPs in each country
- Increase availability of core components
- Allow for billing of VoIP calls
- Allow for security

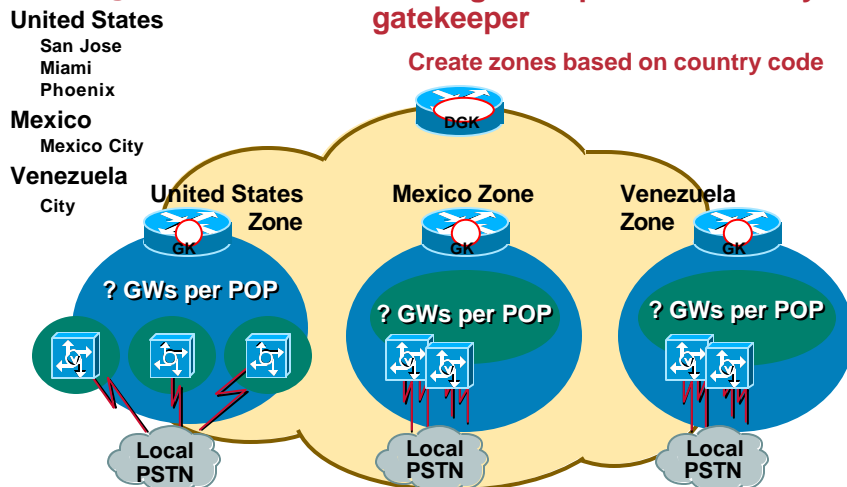

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

47

Case Study Design

Cisco.com

- **Coverage Area**
- **Use of gatekeeper and directory gatekeeper**

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

48

POP Sizing—Number of GWs per POP

Cisco.com

Assumptions:

- POP must service 18,000 BHCA
- Each call has 3 minute Hold Time (HT)
- Number of DS0s per GW is platform dependent
- **120 E1 DS0s per GW (AS5300)**
- 5 CPS max x 60 sec/min x 60 min/hr = **18,000 BHCA** for POP

Calculating number of GWs:

- **Calls/DS0 per hour**

$$= (60 \text{ min/hour}) / (\text{hold time})$$

$$= 60/3$$

$$= \mathbf{20 \text{ BHCA/DS0}}$$
- **BHCA capacity of AS5300**

$$= (\text{DS0/GW}) * (\text{BHCA/DS0})$$

$$= 120 * 20$$

$$= \mathbf{2,400 \text{ BHCA/GW (0.67 calls/sec)}}$$
- **# GWs needed**

$$= (\text{POP BHCA}) / (\text{BHCA/GW})$$

$$= \mathbf{X/2400 \text{ GWs needed}}$$

$$= \mathbf{18,000/2400 \text{ GWs needed}}$$

$$= \mathbf{7.5 \text{ GW} = 8 \text{ GWs needed}}$$

To support 18,000 BHCA

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

49

Number of GKs Needed for Given GWs

Cisco.com

Assumptions:

- Consider the max CPS for a GW; This varies depending on platform
- I.e. AS5300 = 2 CPS
- **# GWs x 2CPS = Max CPS on GK**

Calculating Number of GKs Required to Administer 8 GWs

- **Total GWs in US x GW max CPS**

$$= 24 * 2$$

$$= \mathbf{48 \text{ CPS Max}}$$
- **Refer to performance numbers**

Where:
Endpoints = 24
48 CPS max

We have seen call success rates of 99% with 100 endpoints at 60 CPS

This falls within approved range of performance

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

50

Dimensioning—Number of DGKs Needed for Given GKs

Cisco.com

Assumptions:

- Design in DGK to be under 65% CPU utilization
- Testbed: 100% of new calls on GK utilized DGK (e.g. 60 CPS); Findings determined that each GK uses 8–10% of the DGK CPU
- For GKs that send 100% of new calls to DGK, 6 GKs will use 60% of DGK CPU
6:1 GK/DGK ratio
- Typical DGK deployments handle less than 100% of new calls; GK/DGK ratios will increase

Calculating Number of DGKs Required to Administer GKs

- For case study
- Total GKs in network = 3
- The total GK RAS messaging sent to DGK is estimated at 20%
- Since 6:1 GK/DGK ratio for 100% new calls, then at 20% = 30:1 ratio

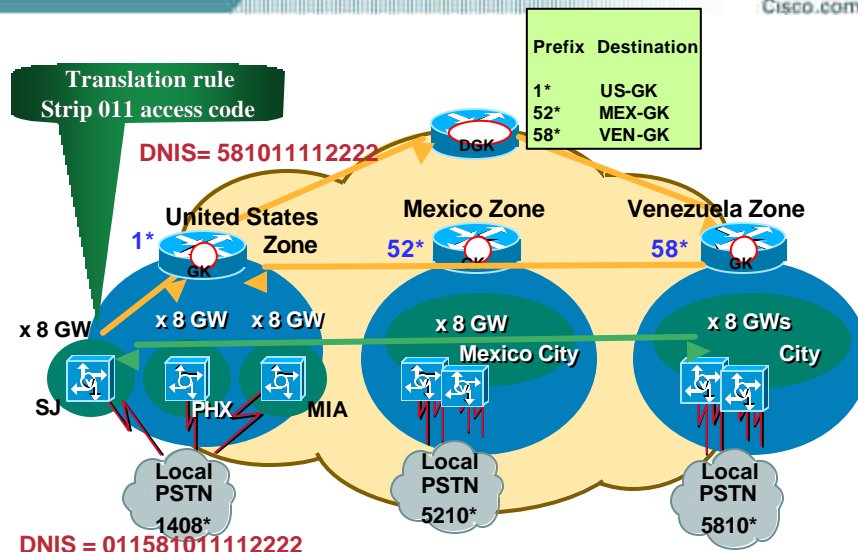

**Recommendation is
6:1 GK:DGK ratio**

Increasing Availability in the H.323 Network

Cisco.com

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

58

Redundancy Mechanisms

Cisco.com

- **Gateways**
 - Multiple GWs servicing same coverage area
 - Rotary dial peers
 - RAI, GW priority
- **Zone gatekeeper**
 - Alternate GK
 - GK clustering
- **Directory GK**
 - HSRP
 - Alternate DGK

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

59

Rotary Dial Peers

Cisco.com

- Multiple dial-peers with a **preference** assigned to dial-peers to establish order
 - Zero is the highest priority (default)
 - Nine is the lowest priority
- Select dial-peer based on longest matching destination pattern
 - (e.g. select 55511.. over 555....)
- Then use preference values for equally matching destination patterns
- Dial-peers with equally matching destination patterns and equal preference values are chosen at random

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

60

Rotary Dial Peer Benefits

Cisco.com

- **Simple load balancing**
 - Multiple dial-peers with equal preferences
 - Randomly select a destination gateway if multiple terminating gateways are available
- **Simple least-cost routing**
 - Multiple dial-peers with various preferences.
 - Try the most preferred endpoint first
- **PSTN fall-back (hairpinning)**
 - Re-routes incoming PSTN call back to PSTN if no gateway hop-off point is available on the VoIP network

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

61

62

Call Admission Control to Route Calls to Free Resources

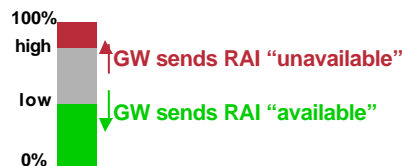

Cisco.com

- What happens when a Gateway is "getting full"?

H.323 Resource Availability Indicator (RAI) informs Gatekeeper when no Circuits (DSOs) or DSPs available

Gatekeeper can select best available GW the first time to increase call completion rates and lower post-dial delay

Once the gatekeeper receives the RAI it will not assign a call to the gateway low on resources.

VVT-221
2015_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

63

RAI Configuration Example

Cisco.com

```
gw1(config-gateway)# resource threshold [all] [high %-value]
[low %-value]
```

default: both values are 90%

E.g. resource threshold high 90 low 80

```
gw1(config-gateway)# resource threshold 90 80
```

E.g. resource threshold high 90 low 80

```
5300-GW #show gateway
```

Gateway 5300-GW is registered to Gatekeeper gk.mwest

H323 resource thresholding is Enabled and Active
H323 resource threshold values:

DSP: Low threshold 80, High threshold 90

DSO: Low threshold 80, High threshold 90

VVT-221
2015_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

64

Call Admission Control to Assign Priority to GW

Cisco.com

- GW priority selected on GK to prioritize GW selection
- Gatekeeper can select best available GW the first time to increase call completion rates and lower post-dial delay

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

65

GW Priority Config Example

Cisco.com

```
GK(config)# gatekeeper
GK(config-gk)# zone local west-gk cisco.com 10.1.1.1
GK(config-gk)# zone prefix west-gk 415666.... gw-pri 10 gw1
GK(config-gk)# zone prefix west-gk 415777.... gw-pri 10 gw2
```

default priority is 5

resultant Master list
master list: gw1, gw2
408666 list: pri 10 gw1; pri 5 gw2
408777 list: pri 10 gw2; pri 5 gw1

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

66

Fault Tolerance—Alternate GK

Cisco.com

- Gateways register to the GK

Static registration statement configured on GW

Lightweight RRQs sent from GW to GK as keepalive

- Alternate GK can be added

Secondary registration statement configured with lower priority

If GK fails to send RCF back to GW, RRQ sent to Alternate GW

Alt GK is geographic independent

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

67

GW Configuration for Alternate GK

Cisco.com

```
hostname US-GW1
!
!
interface Ethernet0/0
ip address 172.1.1.1 255.255.255.0
h323-gateway voip interface
h323-gateway voip id NA-GK ipaddr 172.1.1.2 1719 priority 1
h323-gateway voip id NA-ALTGK ipaddr 172.1.1.3 1719 priority 2
h323-gateway voip h323-id US-GW1
!
```

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

68

Fault Tolerance—HSRP at the DGK

Cisco.com

- **Directory GK can use a backup DGK with HSRP**
 - Standard Cisco Hot Swap Routing Protocol
 - Interval time can be configured (default = 10 sec)
 - Convergence time
 - Must be on same LAN
 - HSRP only used on DGK, since zone HSRP GK cannot support GW registrations

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

69

Sample Configuration HSRP at the DGK

Cisco.com

ACTIVE ROUTER

```
!  
interface FastEthernet0/0  
ip address 99.1.1.1 255.255.255.0  
duplex auto  
speed auto  
standby 1 priority 110  
standby 1 ip 99.1.1.3  
standby timers x x
```

STANDBY ROUTER

```
!  
interface FastEthernet0/0  
ip address 99.1.1.2 255.255.255.0  
duplex auto  
speed auto  
standby 1 priority 100  
standby 1 ip 99.1.1.3
```

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

70

Fault Tolerance – Secondary Directory GK

Cisco.com

Used to backup the HSRP DGK pair

HSRP pair may take x seconds to complete failover (default = 10 sec)

Calls not processed during this failover time

Uses sequential LRQ from zone GK to enable secondary DGK

Interval time between #1 and #2 is configurable in ms on zone GK

Zone prefix table on Secondary configured identical to Primary DGK

VVT-221
2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

71

Sample Configuration Secondary Directory GK

Cisco.com

• Secondary DGK

Special configuration required at Zone GK

```
gatekeeper
zone local GK netman.com 11.1.1.1 1719
zone remote DGK netman.com 99.1.1.3 1719
zone remote SecDGK netman.com 100.1.1.1 1719
zone prefix US-GK 408*
zone prefix DGK *
zone prefix SecDGK *
lrq forward-queries
```

Zone prefix table on AltDGK should match primary DGK

VVT-221
2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

72

Fault Tolerance—GK Clustering

Cisco.com

- Gatekeepers can be configured as “Cluster”

Cluster consists of up to 5 Gatekeepers

Aimed at increasing CPS throughput and endpoints registered

Allows individual GKs to collect group information such as Registrations, Bandwidth, and individual load

Clustering benefits include redundancy, load-balancing/sharing

Uses Gateway Uptime Protocol (GUP)

External entity needs to only send LRQ to one member of cluster

LRQ load shared between elements of the cluster

VVT-221

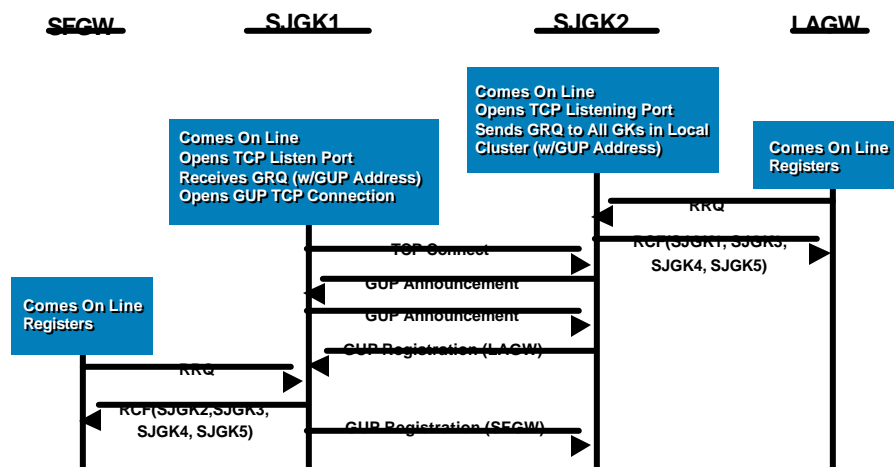

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

73

Redundancy (GUP, Message Flow)

Cisco.com

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

74

Redundancy

Cisco.com

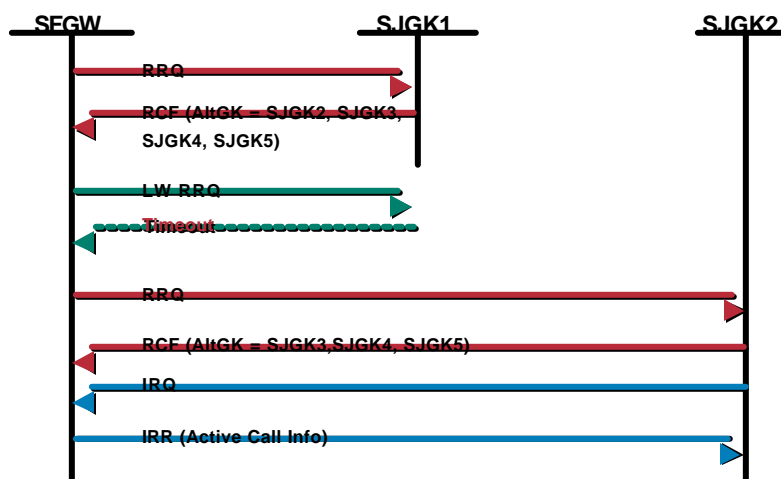

- Endpoints are informed of the alternate Gatekeepers at Registration (RCF) in priority order
- Endpoints re-register with the highest priority alternate if primary fails

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

75

Redundancy (Message Flow) When One GK Becomes Unavailable

Cisco.com

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

76

Load Balancing

Cisco.com

- If a GK gets overloaded, it may ask an Endpoint to go to another GK in the local cluster
- The Endpoint gives the new GK a list of active calls via IRRs
- Does not balance loads equally but is a means to offload extra load
- Gatekeeper will send the list of best alternate in RCF/RRJ or ARJ to endpoints; this list changes real-time, depending on load conditions

VVT-221
2015_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

80

Case Study: Adding in Redundancy

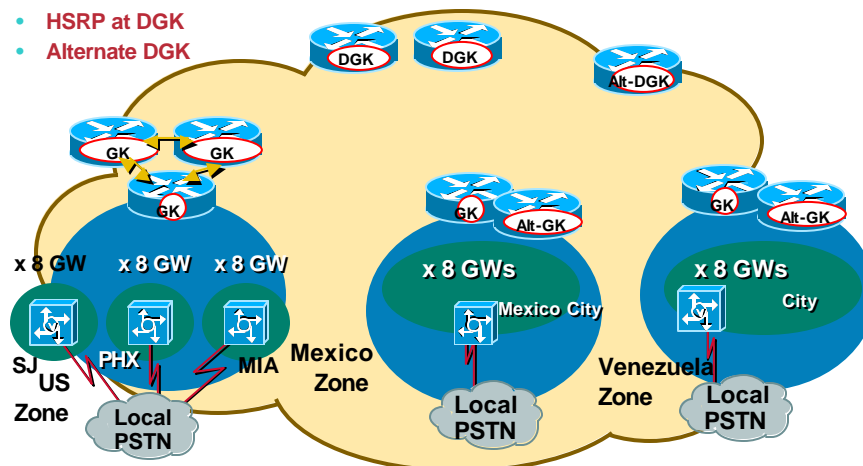

Customer A Design Needs

- Allow for POPs located in 5 cities
- Traffic needs
 - 18,000 BHCA for each POP
 - 5 CPS Calls Per Second for each POP
- Enable network to scale to allow addition of 5 new POPs in next 6 months
- **Increase availability of core components**
- Allow for billing of VoIP calls
- Allow for security

Case Study Adding Redundancy

Cisco.com

- Clustering for US zone
- Alternate GK at Mexico and Venezuela zone
- HSRP at DGK
- Alternate DGK

VVT-221

84

Call Legs

Cisco.com

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

85

Call Leg Records

Cisco.com

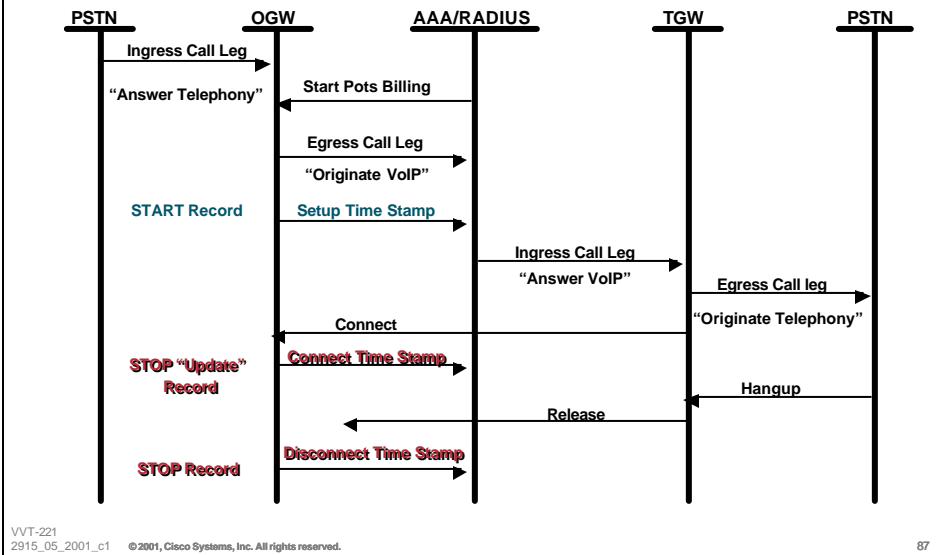

- Each call leg generates start, update and stop records
- Each record has information specific to its call leg
- Each call leg reports the NTP time for when the SETUP (start) was issued, the call was CONNECTED (update) and the DISCONNECT (stop) was received
- The stop records have the information for billing
- The various call leg records for a single end-to-end call can be correlated using the **conference ID**

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

86

Billing Call Flow

Cisco.com

Which Call Leg Do We Bill On?

Cisco.com

- Generally speaking, bill from call legs 2 or 3
- Connect state is determined off of call leg 2 or 3
- Call leg 1 will have excess time (user authentication, IVR, radius authorization)

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved. 88

Timestamps – “Let’s get in Sync..”

Cisco.com

- Each call leg reports the NTP time for when the SETUP was issued, the call was CONNECTED and the DISCONNECT was received

No NTP = Invalid Timestamps

*Jan 1 00:02:17.502: connect time : *16:02:10.842 PST Fri Dec 31 1999

*Jan 1 00:02:17.502: disconnect time : *16:02:17.502 PST Fri Dec 31 1999

VVT-221

Security Options

Cisco.com

- H.235 security
- Class of Restriction
- Access Control Lists

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved. 92

H.235 Security

Cisco.com

- Can be configured for:
 - GW registration only
 - Per call only
 - Both
- **GW Registration Security**
 - Secure Registration from GWs
 - GK validates source of RAS messages with AAA Server using Access Token (AT) – Chap-like
 - Access Token = GW password + H.323 ID
- **Per Call Security**
 - For per call, authenticates users of gateways rather than the gateways themselves using ARQ/ACF
 - 2 CPS limitation on GK to AAA interaction; may not be suitable for high call volumes, intra-domain

VVT-221

96

H.323 Class of Restriction (COR)

Cisco.com

- Determine inbound/outbound classification rules
- Administratively group dial-peers
- Apply to dial-peers to allow/disallow dial-peers from utilizing other “groups” of dial-peers
- COR specifies which incoming dial-peer can use which outgoing dial-peer to make a call
- Example A: Offnet callers cannot dial anywhere but to 140852xxxx (PBX)
- Example B: FXS phones A and B can only call 1-800 #'s and each other, but FXS phone C and D can call anywhere

VVT-221

110

H.323 LRQ Forwarding

Cisco.com

- **LRQ from Directory Gatekeeper**
Trusted Peer relationship needed between carriers
- **Call Routing**
Routes queried by LRQ forwarding on each DGK
- **Billing**
Billing settled by exchange of CDRs from dedicated RADIUS Server
Optional mediation server
- **Security**
H.235 Token Security, Access Control Lists, Class of Restriction

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

111

Open Settlements Protocol

Cisco.com

- **Open Settlements Protocol (OSP)** - server used in clearinghouse for interdomain call routing, billing, and security
- **Call Routing** - Routes configured centrally on OSP Server
- **Billing** - Billing settled centrally on OSP Server
- **Security** - Token based
Each GW in wholesale network need to have OSP client.
Transit GW needed to integrate existing DGK based network

VVT-221

2915_05_2001_c1

© 2001, Cisco Systems, Inc. All rights reserved.

112

OSP Configuration Example

```

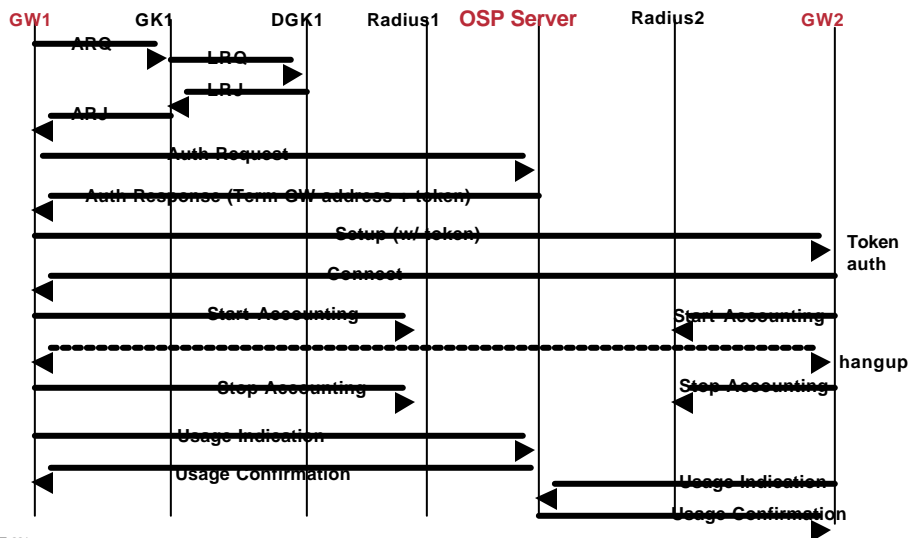

hostname GW1
!
crypto ca identity OSPserv
enccrypto ca identity OSP_clear
enrollment url http://10.1.1.1:80/81
crl optional
crypto ca certificate chain OSP_clear
certificate 54
30820206 3082016F A0030201 02020154 300D0609...
!
settlement 0
type osp
url http://10.1.1.1
encryption des-cbc-sha

!
dial-peer voice 1 voip
destination-pattern 1*
session target ras
Preference 1
!
dial-peer voice 2 voip
destination-pattern 61*
session target settlement:0
Preference 2
!
    
```

114

OSP Based Interconnect

Adding the Transit GW for OSP Interconnect

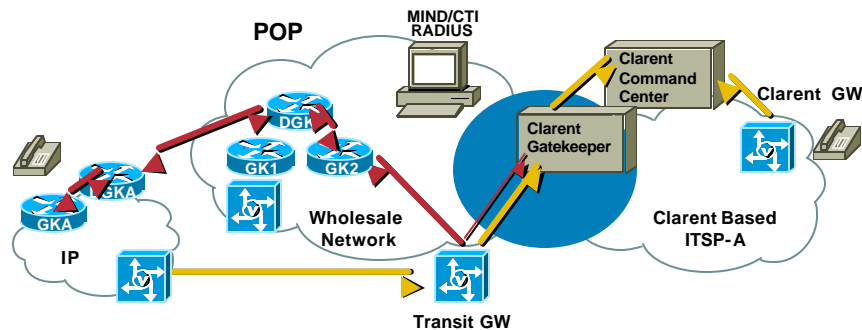

Interconnecting to Non-Cisco-Based Carriers

VVT-221
2915_05_2001_c1 © 2001, Cisco Systems, Inc. All rights reserved.

117

Adding the Transit GW for Clarent Interconnect

- A single GW can only register to one GK
- Clarent Command Center does not support H.323, only proprietary Clarent protocol
- Clarent Gatekeeper supports H.323 on one side, proprietary Clarent on other side
- Transit zone created with Transit GWs, to allow Clarent Interconnect
- Transit GW sends SETUP message to Clarent Command Center, since it uses gatekeeper routed call signaling method

VVT-221

119

Distributed Phone-to-Phone Calling Card Solution

- **Originating GW supports IVR capabilities**

- Provides user authentication before entering network
- Processing associated with IVR functions pushed to the edge
- Customizable scripts using TCL
- Multi-language support
- Individual service branding to simultaneously host multiple retail applications on a single network

- **AAA server**

- Provides real-time billing for pre-paid applications

- **RTSP server**

- Provides audio announcement streaming

- **TFTP server**

- Stores IVR scripts and prompts for centralized distribution

124

GKTMP on GK

Cisco.com

- GKTMP interface on GK for enhanced services

Northbound interface extends Cisco's Open Packet Telephony architecture philosophy to GK and DGK platforms

Allows more flexibility and quicker development of new services using third party partners opposed to closed systems

Can customize specific RAS messages to trigger up to the GKTMP server for enhanced service logic

- GK supported on various platforms depending upon desired performance

3660 (IP/H.323 feature set)

7200 (Enterprise feature set)

CiscoWorks—Cisco Voice Manager v2.02

Cisco.com

- **Network Performance Reporting**

Stand alone product not suited to service provider scaling needs

Requires integration with third party partner for effective distributed reporting solution

CVM polls GWs for call history statistics and provides an open interface for third party management systems to gather and correlate data

CVM provides a clean, well-formatted VoIP call history file to third party applications to obscure Cisco platform specifics

Reporting data is useful for troubleshooting and traffic forecasting

Example reports include answer seizure rate, call success rate, call volumes, and disconnect reasons

Models hierarchical GK design for scalability; CVM resources may be inserted on demand as capacity and network coverage area grows

Cisco Voice Manager v2.02 (Cont.)

Cisco.com

- **Element management**

Supports basic VoIP configuration parameters (e.g. interface signaling types, dial-peers, H.323 registrations)

Simple dial plan provisioning within a local region only

Supports SNMP MIB management of any SNMP capable device

- **SNMP trap viewing and forwarding**

Can receive and collect traps from GWs via SNMP

Traps may be forwarded onto Cisco Info Center for event correlation

Cisco Internet Performance Manager (IPM)

Cisco.com

- Provides real-time and historical network performance reports on VoIP characteristics such as latency, jitter, packet errors, and packet loss for all available IP paths
- Measures network performance on a hop-by-hop basis to pinpoint latency and jitter causes and reduce problem isolation and resolution time
- Generates traps based on response time thresholds to provide real-time alerting of potential problems
- Works with Cisco IOS Service Assurance Agent (SAA) to support service level measurement

136

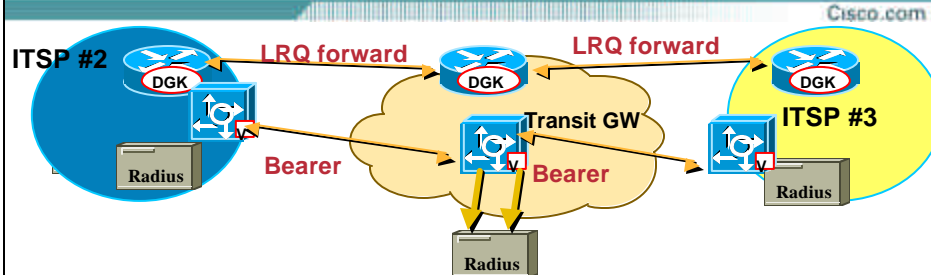

IPM Deployment Architecture

Adding an Alternate Gatekeeper at North America Zone

Interconnecting 2 ITSPs through Wholesaler

- **Transit GW in Wholesaler**
Inserted into call signaling path
- **Billing**
Both originating and terminating call legs accounted on RADIUS server
